why ten?

prof. dr. nicolas meseth

1. the place value trick
2. why two?
3. reading bytes
4. colours as digits

part 1

the place value trick

why do we count to ten?

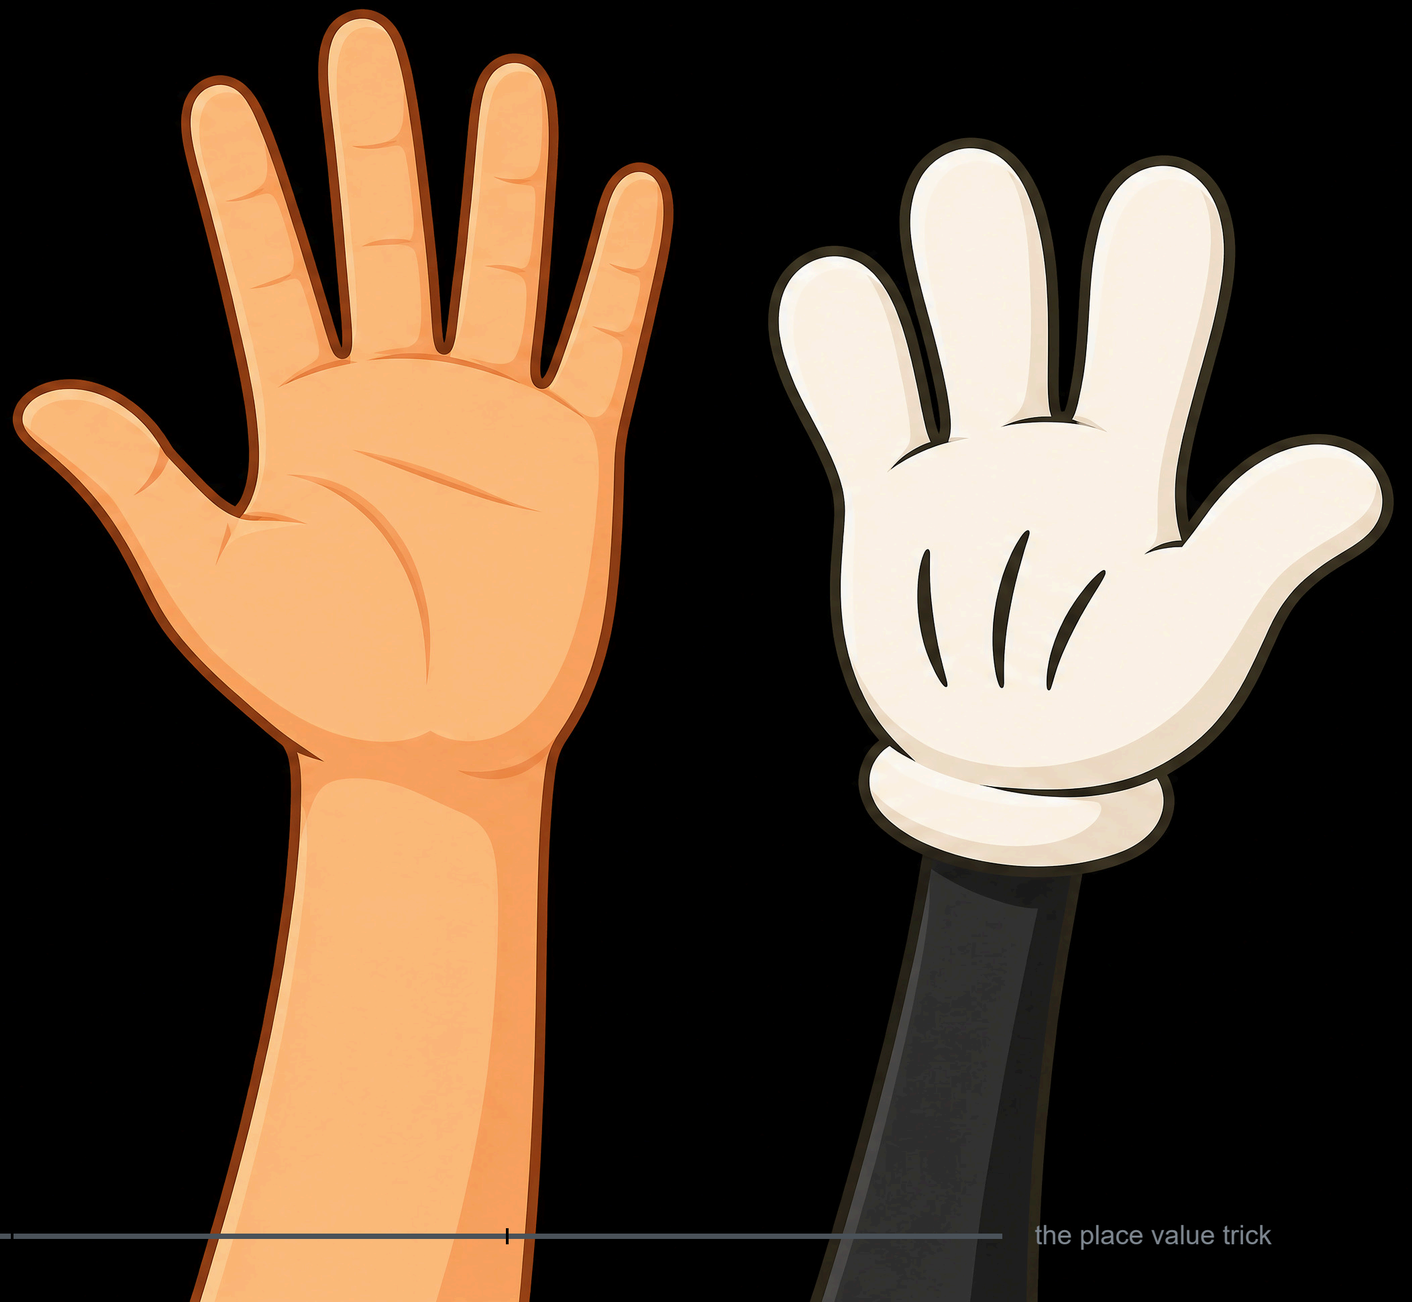

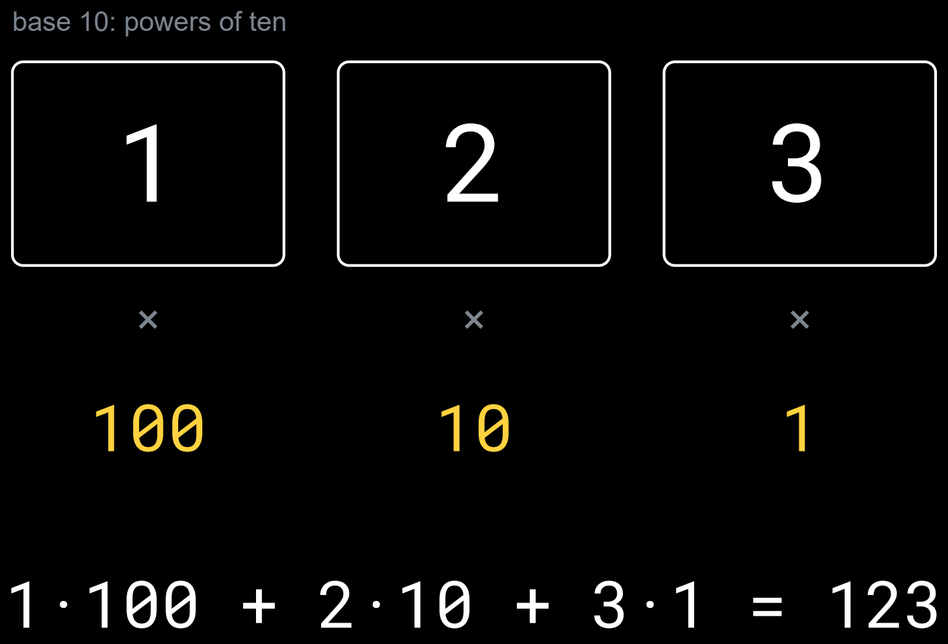

image: ai-generated (gpt-image-2)

what 123 really says

base 10: powers of ten

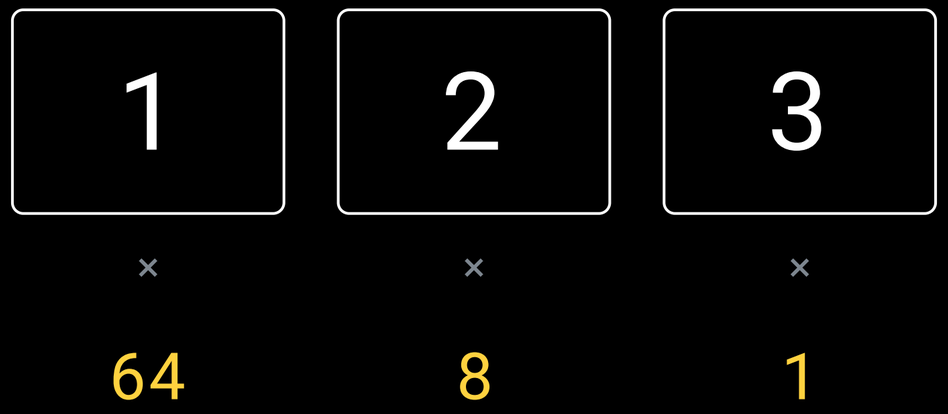

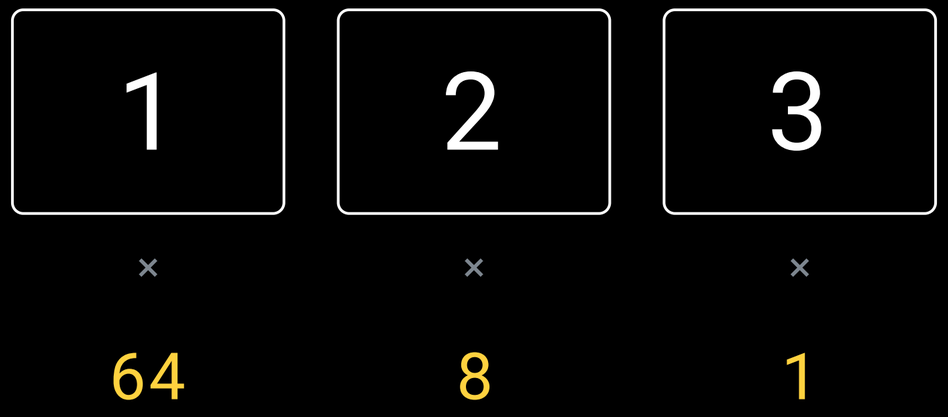

every place carries a power of ten.

the eight-finger creature writes 123

base 8: powers of eight

base 8: powers of eight

$$1 \cdot 64 + 2 \cdot 8 + 3 \cdot 1 = 83$$

the same recipe with another base gives another number.

and a creature with two flippers?

image: ai-generated (gpt-image-2)

two flippers: counting in binary

we write	the dolphin writes
0	0
1	1
2	?
3	
4	
5	
6	
7	
8	

two flippers: counting in binary

we write	the dolphin writes
0	0
1	1
2	10
3	?
4	
5	
6	
7	
8	

two flippers: counting in binary

we write	the dolphin writes
0	0
1	1
2	10
3	11
4	?
5	
6	
7	
8	

two flippers: counting in binary

we write	the dolphin writes
0	0
1	1
2	10
3	11
4	100
5	?
6	
7	
8	

two flippers: counting in binary

we write	the dolphin writes
0	0
1	1
2	10
3	11
4	100
5	101
6	?
7	
8	

two flippers: counting in binary

we write	the dolphin writes
0	0
1	1
2	10
3	11
4	100
5	101
6	110
7	?
8	

two flippers: counting in binary

we write	the dolphin writes
0	0
1	1
2	10
3	11
4	100
5	101
6	110
7	111
8	?

two flippers: counting in binary

we write	the dolphin writes
0	0
1	1
2	10
3	11
4	100
5	101
6	110
7	111
8	1000

a new place opens
when the digits run out,
just like 9 to 10

the dolphin writes 110

base 2: powers of two

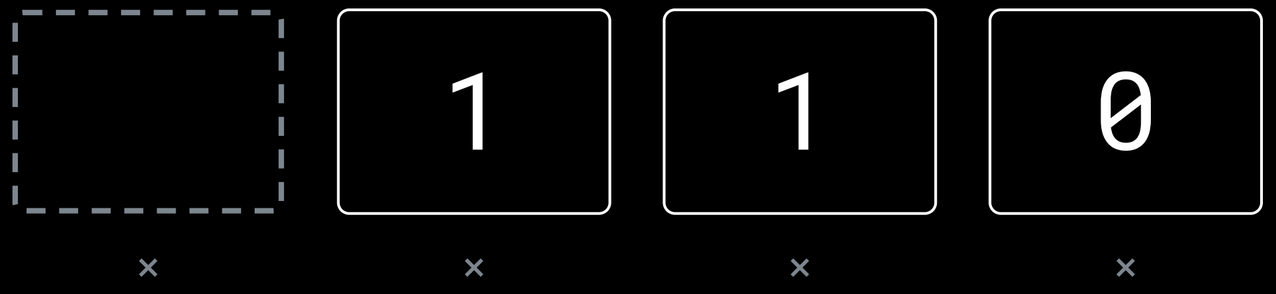

base 2: powers of two

$$1 \cdot 4 + 1 \cdot 2 + 0 \cdot 1 = 6$$

nothing new: the third time is the same trick.

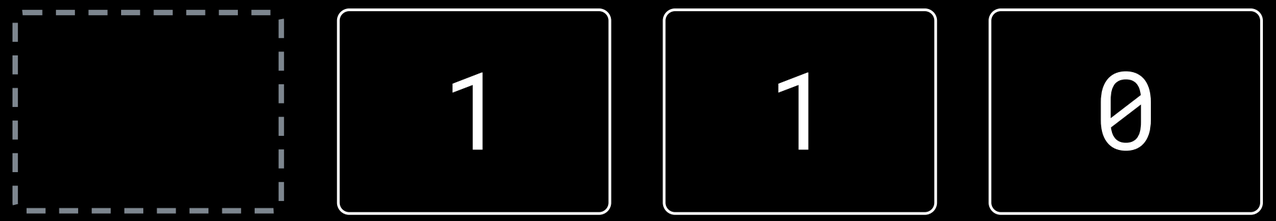

base 2: powers of two

$$1 \cdot 4 + 1 \cdot 2 + 0 \cdot 1 = 6$$

nothing new: the third time is the same trick.

base 2: powers of two

× × × ×

8 4 2 1

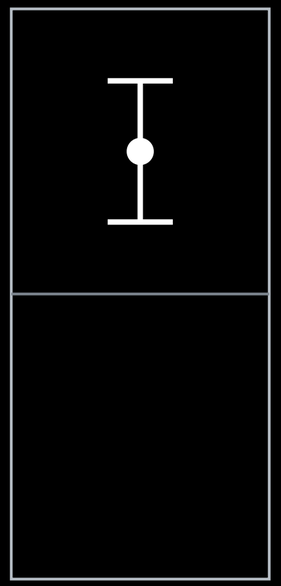

$$1 \cdot 4 + 1 \cdot 2 + 0 \cdot 1 = 6$$

nothing new: the third time is the same trick.

part 2

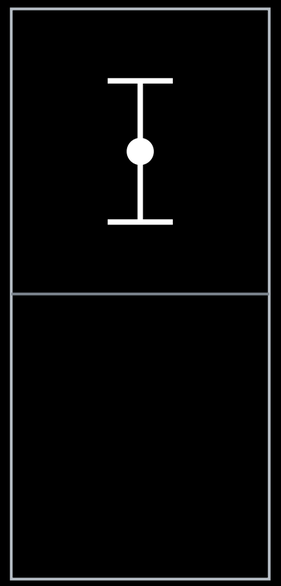

why two?

why two, of all things?

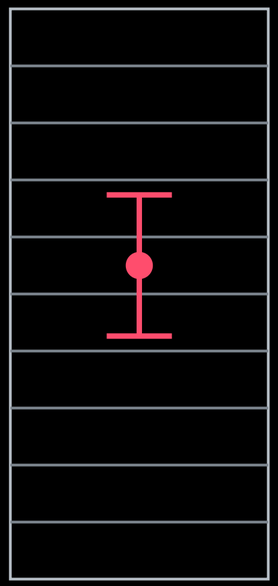

2 states

why two, of all things?

2 states

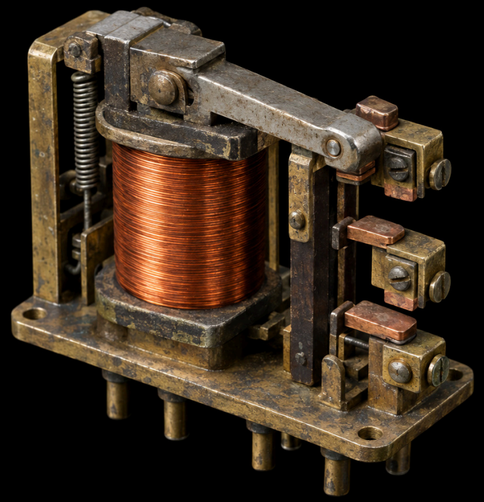

10 states

the same wobble on the wire.
with two states it never matters,
with ten it always does.

the price: more places.
places are cheap.

two states are the cheapest thing you can build reliably.

three generations of the same switch

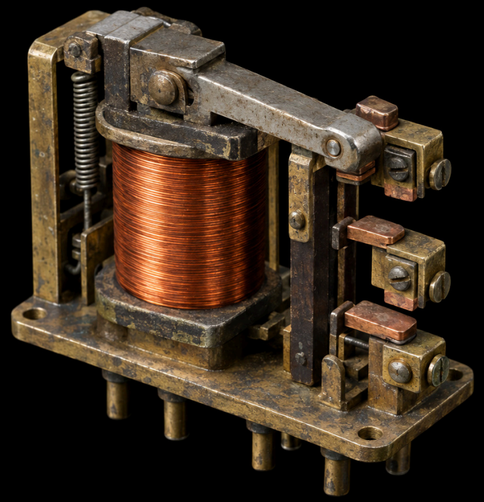

relay

zuse's z3, 1941: about 2,600 of them

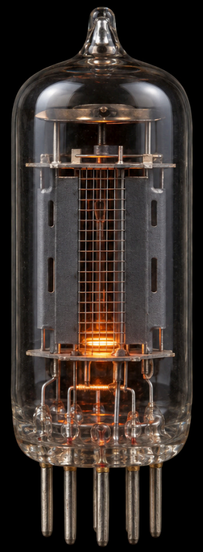

images: ai-generated (gpt-image-2.5-flare)

three generations of the same switch

relay

zuse's z3, 1941: about 2,600 of them

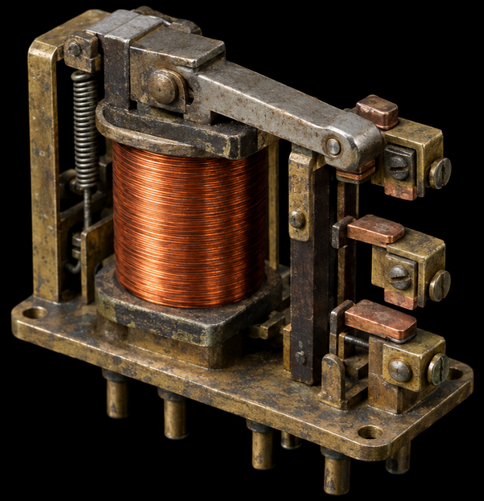

vacuum tube

eniac, 1945: 17,468 of them

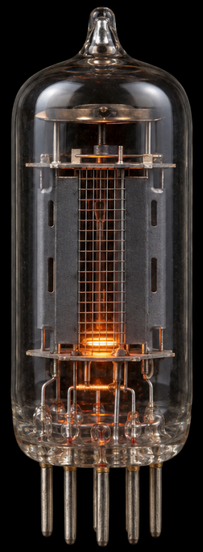

images: ai-generated (gpt-image-2.5-flare)

three generations of the same switch

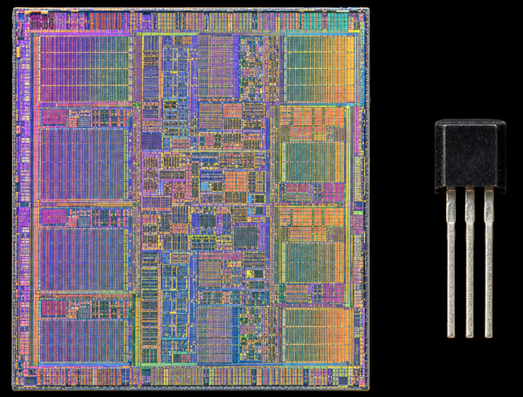

relay

zuse's z3, 1941: about 2,600 of them

vacuum tube

eniac, 1945: 17,468 of them

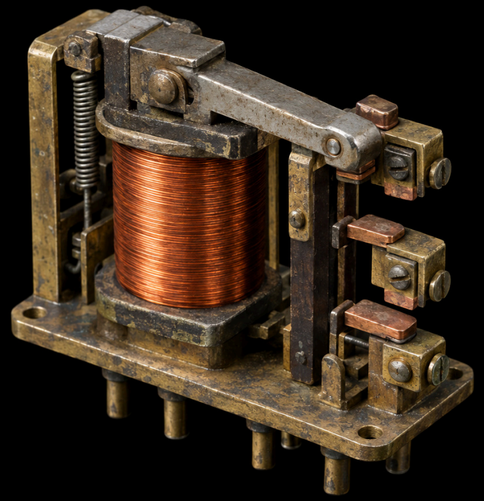

transistor

today: billions on a single chip

images: ai-generated (gpt-image-2.5-flare)

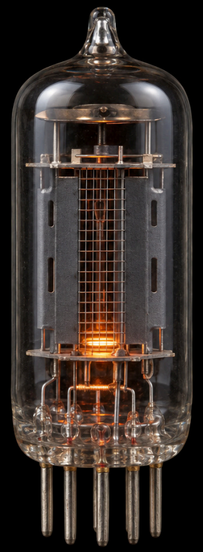

why two?

three generations of the same switch

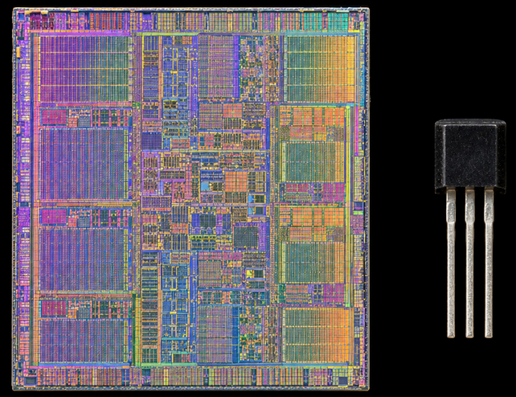

relay

zuse's z3, 1941: about 2,600 of them

vacuum tube

eniac, 1945: 17,468 of them

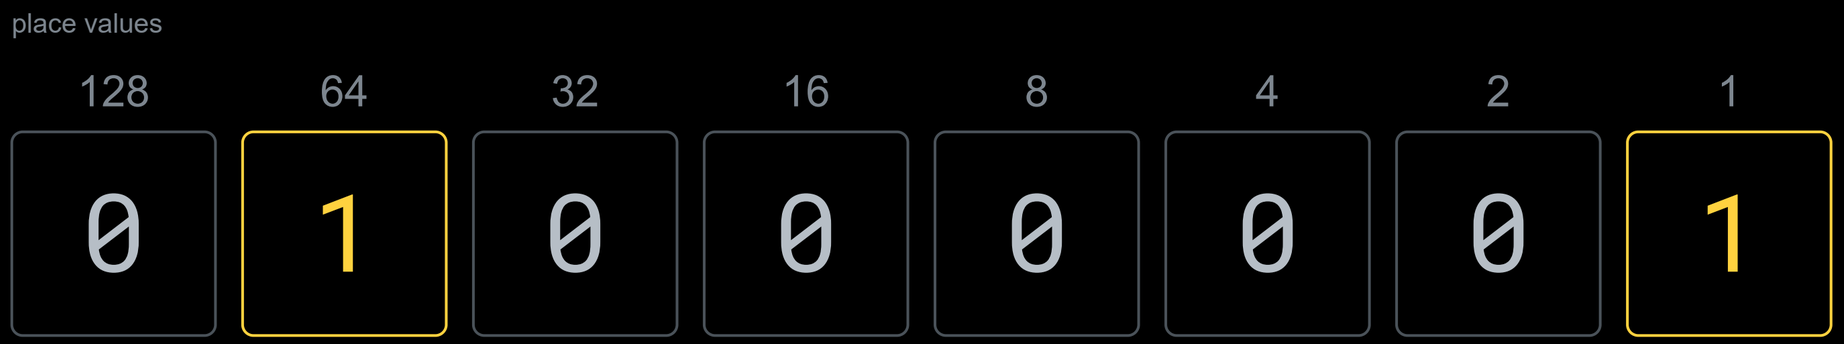

transistor

today: billions on a single chip

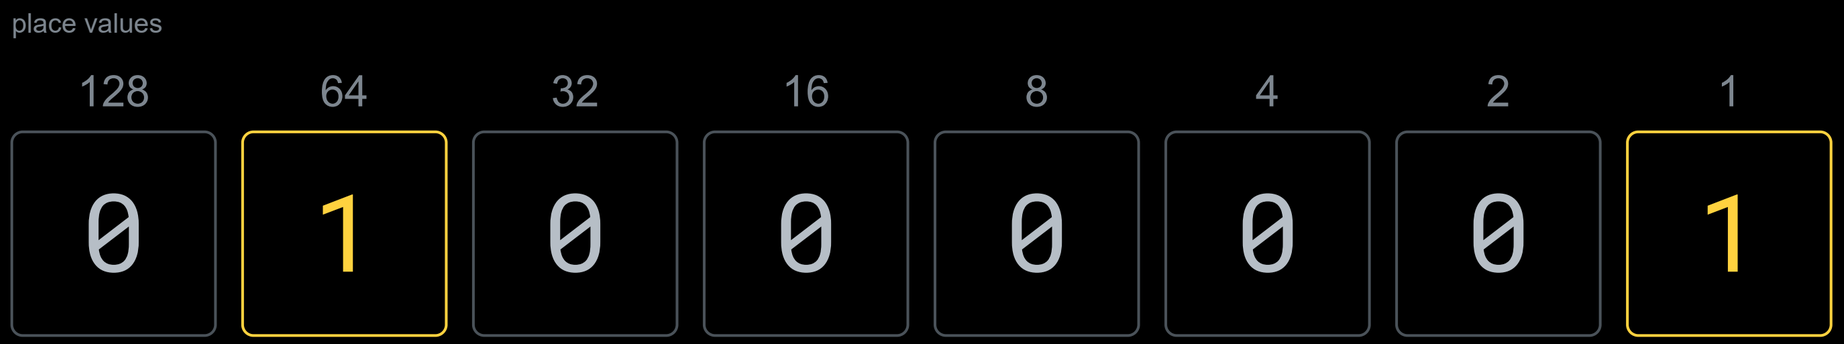

a relay clicks, a tube glows and a transistor conducts, yet each of them knows only on and off.

images: ai-generated (gpt-image-2.5-flare)

eight bits make a byte

eight bits make a byte

$$64 + 1 = 65$$

$2^8 = 256$ values, 0 to 255

256 values, and every one of them is a place value sum.

the byte switchboard: hands-on-computer-science.de/cs/en/items/byte-switchboard

which switch changes the number the most?
how do you set 255, and how do you set 1?
what happens when you count one step past 255?

part 3

reading bytes

you have seen these before

`#ECAB03`	a colour on a web page
`3C:22:FB:9A:01:7E`	the address of a network card
`U+00E4`	the letter ä in Unicode
`0x80070005`	an error code in Windows
`89 50 4E 47`	the first bytes of every PNG file

you have seen these before

`#ECAB03`	a colour on a web page
`3C:22:FB:9A:01:7E`	the address of a network card
`U+00E4`	the letter ä in Unicode
`0x80070005`	an error code in Windows
`89 50 4E 47`	the first bytes of every PNG file

only the digits 0 to 9 and the letters A to F, and nothing else

and a creature with sixteen fingers?

image: ai-generated (gpt-image-2.5-sunburst)

sixteen fingers: counting in hex

we write	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
the alien writes	0	1	2	3	4	5	6	7	8	9	?							

sixteen fingers: counting in hex

we write	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
the alien writes	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F	?	

ten digits are not enough, so six letters help out: A is 10, F is 15

sixteen fingers: counting in hex

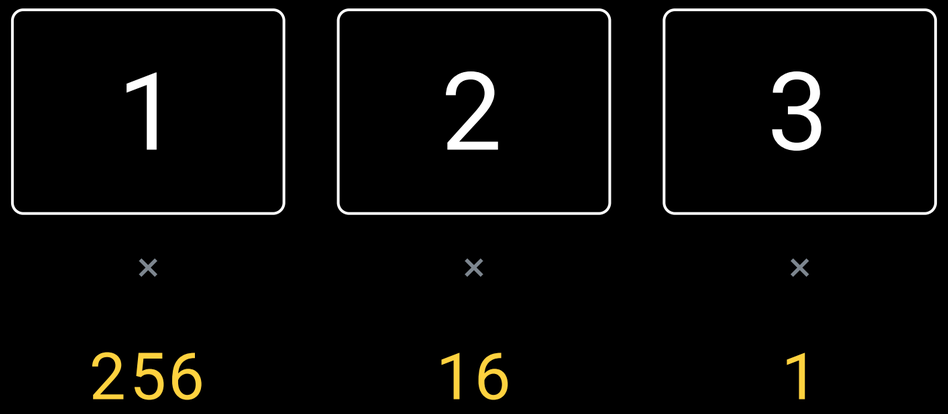

we write	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
the alien writes	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F	10	11

ten digits are not enough, so six letters help out: A is 10, F is 15

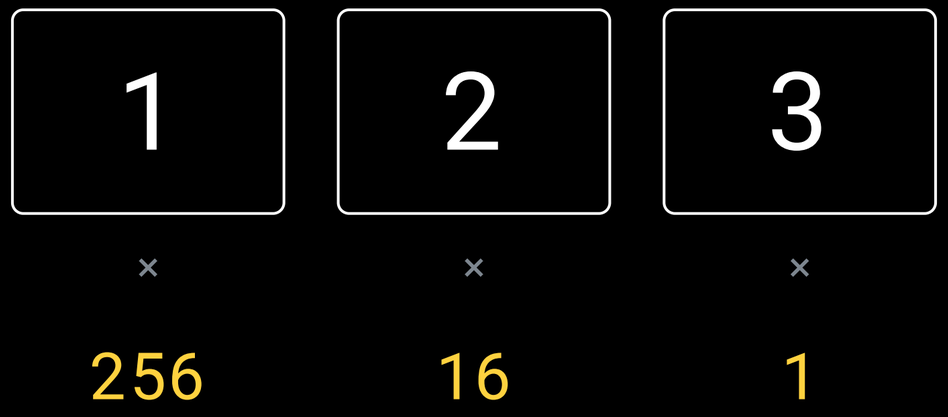

after F the digits run out, and a new place opens: 10 means sixteen

the alien writes 123

base 16: powers of sixteen

base 16: powers of sixteen

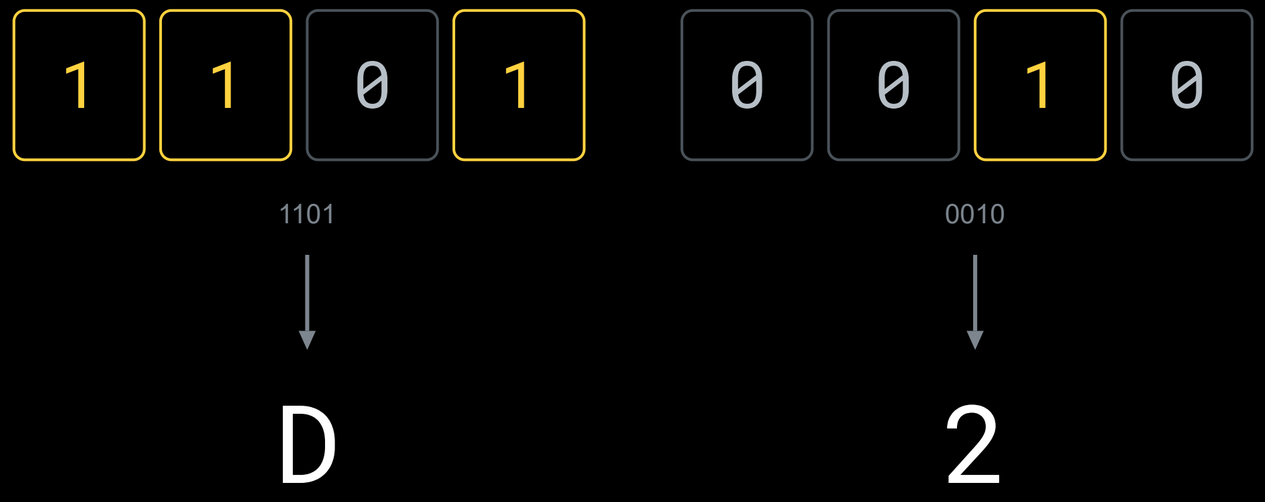

$$1 \cdot 256 + 2 \cdot 16 + 3 \cdot 1 = 291$$

the recipe does not care how many fingers you have.

hex: four bits at a time

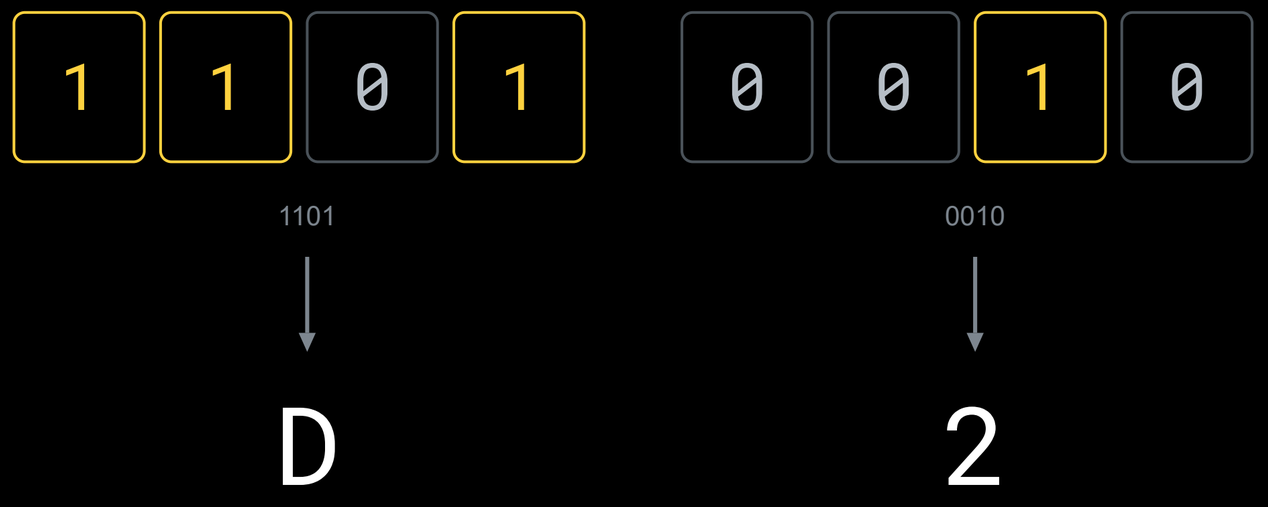

hex: four bits at a time

four bits have 16 states.
so one hex digit fits a nibble,
and a byte fits two.

hex: four bits at a time

four bits have 16 states.
so one hex digit fits a nibble,
and a byte fits two.

$$D2 = 13 \cdot 16 + 2 \cdot 1 = 210$$

hex is not a new number world, only a reading aid for bytes.

the same file, twice

the bytes, in hex	the same bytes as characters
`89 50 4E 47 0D 0A 1A 0A`	`.PNG....`
`00 00 00 0D 49 48 44 52`	`....IHDR`

the same file, twice

the bytes, in hex	the same bytes as characters
89 50 4E 47 0D 0A 1A 0A	.PNG....
00 00 00 0D 49 48 44 52	....IHDR

every png file starts like this: the first bytes say what kind of file it is.
a dot stands for a byte that is not a printable character.

try it: look inside any file

the hex viewer: hands-on-computer-science.de/cs/en/items/hex-viewer

how do a photo, a pdf and a word document begin?
where in a text file do you find the line breaks?
how many bytes does an umlaut take, and how many an emoji?

two ladders of units

	decimal: each step × 1000		binary: each step × 1024	
byte	10^{0}	1	2^{0}	1
kilobyte	10^{3}	1 000	2^{10}	1 024
megabyte	10^{6}	1 000 000	2^{20}	1 048 576
gigabyte	10^{9}	1 000 000 000	2^{30}	1 073 741 824
terabyte	10^{12}	1 000 000 000 000	2^{40}	1 099 511 627 776

both are called the same in everyday speech. that is where the trouble starts.

on the box:
1 TB

`1 000 000 000 000 bytes`

counted up the decimal ladder, × 1000

`1 000 000 000 000 bytes`

counted up the decimal ladder, × 1000

`1 000 000 000 000 ÷ 1 073 741 824`

counted down the binary ladder, ÷ 1024^3

nobody cheated: there are two ladders and one word.

part 4

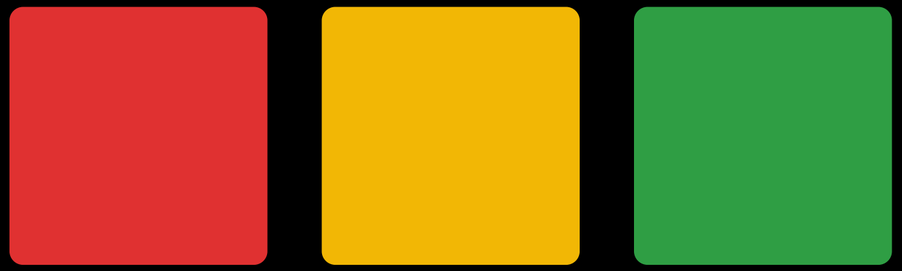

colours as digits

colours can be digits too

the agreed digits

- 0
- 1
- 2
- 3

one character, three colour positions

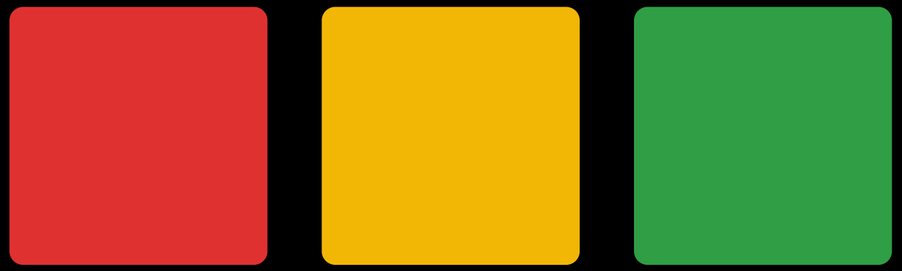

$\times 4^2$ $\times 4^1$ $\times 4^0$

colours can be digits too

the agreed digits

- 0
- 1
- 2
- 3

one character, three colour positions

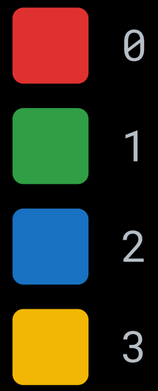

× 4^2 × 4^1 × 4^0

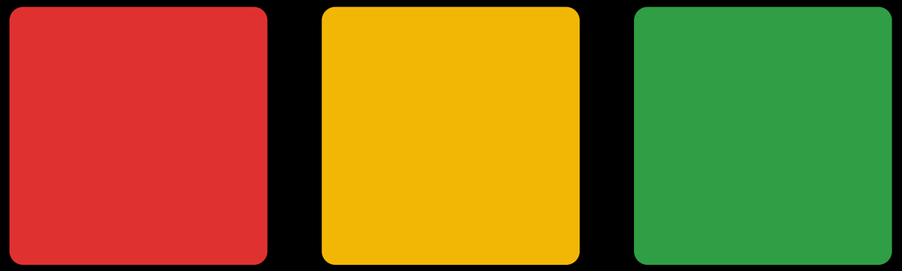

$$0 \cdot 16 + 3 \cdot 4 + 1 \cdot 1 = 13$$

colours can be digits too

the agreed digits

one character, three colour positions

$\times 4^2$ $\times 4^1$ $\times 4^0$

$$0 \cdot 16 + 3 \cdot 4 + 1 \cdot 1 = 13$$

$4^3 = 64$ combinations, enough for an alphabet

k colours are k digits, and position matters.

ten was never special.

ten was never special.

it is the number of fingers on two hands, and nothing else.
